ROADS LOAN ORIGINATION PROTOTYPE

Weekly release notes

November 2–8, 2026 · Changes recorded November 3–5

> The prototype now supports repeatable loan demos, saved application data, rule-driven checklist actions, and Summary figures calculated from loan inputs.

Application data & demo controls

- **Loan-owned persistence.** Saved application fields are stored with the loan rather than the tester, supporting reloads and shared demos.
- **New Demo Controls tab.** Reset application data or import a simulated Blend application with one or two borrowers. Compact, fixed-height cards use secondary buttons and inline confirmation.
- **Targeted resets.** Reset checklist outputs without clearing application inputs. Separate TRID actions clear its application inputs or manually trigger a new Loan Estimate cycle.
- **Working change log.** History records changes to saved values, not initial values. Resetting the application clears the log.

Business rules & checklist behavior

- **TRID.** The six saved application inputs trigger “TRID day 0.” Loan Estimate delivery satisfies it; a rate-lock update triggers it again. The Loan Estimate checklist follows this shared rule.
- **ECOA.** Blend import starts “30 ECOA days remaining.” The chip clears after a decision is rendered and its letter is generated and delivered.
- **Borrower and decision rules.** Two-borrower applications show the joint-credit chip; single-borrower applications do not. A saved credit pull makes the Loan Decision task ready.
- **Demo stage navigation.** Hidden controls on the first and last tracker chevrons move the stage backward or forward without persisting it.

Borrower & collateral improvements

- Added a **Collateral Owner** dropdown populated from the loan’s borrowers, plus saved monthly property-tax and insurance fields.
- Single-borrower information no longer needs a borrower subtab. Updated the header eyebrow to **SLP** and capped contact cards at **435 px**.

CALCULATIONS & VISIBILITY

A more realistic loan summary

November 2–8, 2026

Live Summary calculations

- **Collateral value & L/CV.** Use estimated values until reported values are saved; combine applicable collateral evaluations. L/CV is total loan amount divided by collateral value.
- **Pricing & payments.** Use saved product, rate, supported fee data, and amortization term to calculate supported loan totals and principal-and-interest payments. A rate does not need to be locked for PITI or DTI.
- **PITI & DTI.** PITI is monthly principal, interest, taxes, and insurance divided by gross monthly income. DTI also includes supported monthly liabilities. A PITI tooltip shows the numeric breakdown.
- **Rule of XX.** Add L/CV percentage points to the amortization term in years, using actual loan data rather than a fixed example.
- **Primary wage earner.** Shared income calculations select the highest-income borrower. The PWE chip changes when saved incomes change; the Summary shows that borrower's simulated credit score after a hard credit pull.

Credit demo & debugging

- **Simulated credit results.** Pull Credit populates sample liabilities for each applicable borrower and stores borrower-specific demo scores. Checklist reset clears credit results while retaining application income.
- **Debug modal.** Moved unavailable-calculation details out of the Summary into **More → Debug**. Short, actionable messages identify missing inputs or unsupported rules.
- **Shared logic & checks.** Centralized business rules, pricing data, and income calculations reduce conflicting results. Added focused regression tests for persistence, resets, rules, and calculations.

Still intentionally limited

- **APR, cash reserves, and cash to close** remain unavailable where required inputs or calculation policies have not been defined.
- Unsupported ARM payment assumptions, historical-job income, and planned debt-payoff treatment are surfaced rather than guessed. Missing inputs display as unavailable, not misleading zeroes.
- TRID and ECOA day labels are fixed demo values. Credit data is simulated; this is not a live bureau integration or production compliance engine.

Scope: completed changes in the local project's weekly commit history, checked against implementation context. Earlier architectural-audit and GitHub-sync work is outside this reporting period. This document does not certify deployment status.
